

12H Results–text handoff

Results writing should follow the legend package and safe claim boundaries.

Source–traceable framework

Main Fig 1; Supplement Fig S1–S2

We established a source–traceable computational framework for DA neuron/graft–related transcriptomic cell

Core prioritisation and DA/graft identity

Main Fig 2; Supplement Fig S3

Weak–label prioritisation highlighted candidate transcriptomic states with DA/graft–related identity supp

Temporal and module co–variation

Main Fig 3

Pseudotime and module–score analyses supported maturation–associated and module–coupled transcriptomic st

External/proxy evidence and risk boundaries

Main Fig 4; Supplement Fig S4–S8

External and proxy evidence layers provided contextual support while preserving strict claim boundaries.

Integrated evidence and weak–label ML audit

Main Fig 5; Supplement Fig S9–S10

Integrated evidence tiers and ML audit summarized convergent computational support under a weak–label fra

Limitations / claim boundaries

All main and supplement legends

The framework is hypothesis–generating and requires experimental validation.
